

# Upland Hills Ecological Awareness Center

Oxford, Michigan

The Awareness Center has been educating the public on energy and other environmental issues for over 30 years. The building incorporates passive and active solar, with a green roof that is an extension of the hill it is built into. Solar photovoltaic panels and a wind generator provide much of the building's electrical needs. A 75 foot long slip-formed stone wall using fence row stones holds back the earth and provides mass for heat storage.
